Roland has a potential to feed badly without some degree of suppressing its high end...I would consider using a driver of equal wattage and impedance. You may want to add a 4/10 cabinet. Alamo amps had an attenuator control built into the cabinet to suppress feedback and hiss. I used Roland back in the 70's and early 80's. It also goes well with Peavy 4/10 cabinets. Remember to find a driver that will not over power your primary drive. This only leads to dualing speakers.
