I can't really salivate over a speaker sonstruction thatcan double as a load-bearing support for a house. :-) Just too much. But the Sonotube construct intrigues me and Bill Fitzmaurice made mention that some sub drivers were on deal at MCM. The Shiva costs about $130. Does Eminence or any of the others in the 8" to maybe 10" range meet the requirementsof a sonotube? They show 2 drivers and a longish port on the interior. And where do you put your plate amp? I think the sonotube can be built with off the shelfparts from Home Depot including the circular top and bottom. A groove would have to be cut in pre-made small size'table tops' they have to accept the tube. A 4" hole sawcan make the port cutout for either carpet roll core orPVC. My high school geometry tells me you need the radiusof a circle to find the center. Are there any methods I missedwhich can calculate the center w/out a radius? Alternately, here's a kit I posted some months ago fromCSS:
Sonotube kit
