In his piece on the Alpha TL, Bill Schultz said he used a jig saw to make his cutouts for the Jordan in his initial project (Schultz will be doing another feature for aX some time in the future.) My question here is: Is there a jig/jigsaw that can do small circles accurately. Are there any special tips in attempting to do this freehand? Also would like to see a complete tutorial on the Jasper jig from setup through to the final cuts. I have seen stuff here and there but not what one would call a step by step procedure. I think Jasper should make a video. ;-) lon@athenet.net in Appleton WI
