Ok. This is slightly diffferent (by my reading) than described over at full range driver site. I've done the break-in routine on twopairs of speaks. Method used was putting the speaks face to face andbolting them together. I checked the polarity by using a small battery and test leads and hooked up the wires push andpull respectively. It still makes a good amount of racket. When doing this procedure it'd be handy to have a small safewith wire leads drilled in the back. :-)
