I noticed I had this huge problem getting my rotozip toolcircle cutter to make a cutout the same size... ever. The centering pin might be loosening up as I work the device. Other problem is I am using the smallest diameter the circlemaker has, so I can't simply set it lower. The centering pin is this big fat sloppy thing. I'd be better off to use one of those \$6 attachments for a jig saw, but again, I'm trying to use the smallest dimension for 4" drivers in an array project. I don't know if there's any help for this or not (?) In any case, the box of 50 cent speakers I got on closeout does not suggest any new tool purchases right now... not until Sir Fitz gets his line array published. :-)
