Subject: For a wood chassis, is glue enough?

Building a DAC chassis out of 3/4" solid mahogany used for base and 4 sides. Top wil be 3/16 perforated aluminum. Dimensions are 12"x16"x5". Sides will be connected together using mitered edges. Aluminum top will be screwed down into top of sides. Do I need anything other than glue (wood screws, etc.) to glue the 4 sides together, or the sides to the mahogany base?
