I'm back here to give the answer to the stuck chuck on a craftsman drill problem. I went to the store. They guy had the chuck removed in a bout 2 minutes. The trick was not in using the chuck key. What he did was use the short end of a large diameter allen wrench in the mouth of the chuck and tighten it down. Then a tap with a hammer got it loose. No vise needed, no sweat. Maybe this is in the instruction manual with new drills. I didn't have the book. :-/
