Hey-Hey!!!,Since this resistor is across the entire B+, it should be able to stand worst-case. Say 500V will be plenty. As to power, V-squared over R will give you power. Using 200V for the V-term will give you a value to double. We don't want the thing getting too hot. 200 squared is ~40k so about a watt is reasonable estimaate of actual heat. A 5W ought to be easy enough to source.regards,Douglas Piccard
