Hey-Hey!!!,before one can design what could be losely categorized as a kit, you should decide what it is going to be good for. Some example question:How upgrade/modify-able should it be?---major parts upgrades, circuit upgrades, component flavourWhat is the price-point?---no sense laying out an 845 amp for an EL84 crowdParts availbility?---new production parts, or shall we do some hunting for vintage stuff?I personally don't like the idea of needing new Iron to take a design to the next level. Aside from initial cost, there don't seem to be any real down sides to going after the good stuff.Excluding vintage stuff seems like a reasonable idea, good new production for all but some of the valves is pretty easy to specify.Where would *YOU* start?regards,Dogulas
