Guys; what are you all doing with your CCS. Are you shock mounting them to the chassis with bolts and nuts? Are you tying the output wire's to the solder tabs then letting them hang? Are you glueing or taping the little perfboard squares to the underside of the chassis then wiring them into the circuit? Maybe using very short wires and tying them to the tube pins like Bottlehead does? Which method is most appropriate for this application? Thanks; J.R.
