Hey-Hey!!!,Yes I have. Built with 6AK5, 6AU6, 12BY7, 12GN7, 6AH6, 8136. Missed a few, but the slightly more complex looking cascode works better. Tread Ec2 like the pentode's g2, and you're off. the g2 being in parallel with the plate does funny thigs(I think) to the constant current out of the cathode circuit. The cascode is a series affair, and the pentode is a parallel. You still need a good g2 supply...regards,Douglas
