For cathode biased amp, $U_{ak}=350V$, $U_{gk}=70V$ and voltage drop on the primary winding resistance $U_{rp} = 148 \cdot 0,08 = 11,84V$. Then our B+ is $350+70+12=432V$ DC. I'd "play" with similar OPs, but this is "working" version. And for the "optimum" $R_a...$ depends of what OPT you have /can find:-) I have a LL1664 (3k:8 Ohms), but better solution would be LL1623 (3k/5k6:4,8,16 Ohms, 90mA), then you have more options to try:-)
