I`d like to have a "standard" set of specifications, and measurements. Only "Plitron", IMO has good and detailed specifications, but they don`t have a grid chokes. I suspect that manufacturers don`t want to publish everything, `cos often we can read in various forums "comparisons" of some single parameters in a way, say, "Plitron PAT 4004 has power bandwidth f-3= 22,7 Hz, and much cheaper OPT has 19Hz. Then former is no good, and later is much better".
