It's yours Damir. Have somebody wind it and test it and see. It will get you close to the predicted numbers. And it is in the public domain as long as it is noted that it is not an approved design of our company (MagneQuest). But rather was offered as an exercise to show how Cw could be minimized in isolation by juggling a few different design parameters.that said... it's still a basic design... and could be tricked out much, much further though then we are likely to get into the territory of me not wanting to disclose any of our own proprietary design strategies, methods or goals.but for a free, give away design... it might not be horrible.msl
