See "Voltsecond`s" www page, I think that he adressed many dissipation, voltage and safety issues with C4S CCS. But I think that it isn't that serious - "disaster waiting to happen", :-). I'm not afraid, and I'm gonna use this CCS in my amp permanently. But I can't get any "guarantee" to anybody. Potential builders must choose for yourself are they cappable of "dealing" with high voltages, mosfets and tubes. I mean, I can provide the schematic and the description, but you are on your own - your work/responsibility. My amp works, and the sound is nice. In the next few days I'll post another "report", 6SN7 "family"...
