Try a little "higher" OP, about 200V/-2,3V/8mA. Try to bypass the cathode with good cap, 100 μ F or more. I'd try rechargerable battery and/or diode bias (LED+1N4148 = 2,2...2,3V), or maybe LED+resistor? I tried two LED-biased C3g - better, IMO, than any RC combination I tried.
