hi Damir I build the whole set by myself the speakers are 60cm Oris horns with AER md3 drivers. The woofers are 15 inch bd15 in a b.r cabinet in front hornloaded with 80 cm Oris horns. The woofers are active with a plxxo this is a line level filter direct behind the head amp. So the character of the amp is given to the bass unit. As bass amp i use a diy gainclone with very good power supply big trannie and 14 Black gates in super e cap config. My diy dac is one tda 1543 nonoversampling type. the turntable is also diy and weights 38 kg. (i have a picture if you like) i do it with a link: <http://forum.audiofreaks.nl/index.php?topic=6571.0> scroll down and you see it you cant see the motor on the pictures its a separate engine behind the turntable driven with a very thin wire. Stepup trannies are from Tribute Audio and the phono amp is diy. The passive pre amp are 2 (left and right separate) autoformers from Tribute Audio. Cables are all diy. The sound of the speakers can i explain as it are magnifying glasses the amp that drives them must be very good. Every thing that is not right is direct audible. if you feed them crap you get very much shit. If you give them a little hum you get enormous hum in the room. It must be under the 1 mv and this is still a little audible. but with the right amplifier they can sound like heaven very very detailed with enormous dynamics and pressure also with 1,5 watt. I have also an diy 300b amp but i like the sound of a 45 more. But thats just my taste
