This is actually a broiler pan. I needed the much heavier steel, to support the unusually large iron load, 18# for the PS trans alone. The down side is they are harder to work. I am still using a hole saw to cut the tube sockets. A 1 1/8" will go through a cakepan like cheese. With the broiler pan, I needed cutting oil and time. The upside, they are 3" deep and damn near bullet proof...John
