hey-Hey!!!,I have been working out one for a while now. To do it with a single PS, I'd have to work out some details with Heyboer for winding one with a few electrostatic shields(to isolate the heater winding and primary from the HV). It would be easier with multiple dual-bay transformers(two chassis, yes?)It is fairly simple, gain stage, pasive RIAA gain. First stage will use a pair of 6BK7's in parallel(-3dB in noise from a single), and terminate with a single 6BK7 stage with a DN3545/2540 mu-follower CCS. Schematics soon I'd say...:)cheers,Douglas
