hello rewfrew, your right, initially my 7 pi's sounded great in the basement of my store. this room is an acoustic mess, it attenuates midrange to much. have wayne give you the correct compensation for this flare, it is critical. i built the 4 pi's because the cornerhorns were just too big.i am extremely pleased with their performance, their performance is incredible, huge dynamics, great retrieval of low level information and can move alot of air, characteristics i believe are the most important. keep us posted on your progress. i'll post some images once i stain the cabinets.cheers,george
