Subject: Alpha 8 measuring: wacky results

Hey Wayne et all,I tried to measure my Alpha 8s to see if the specs are closer to the "new" ones or the "old" ones (specs are quite different!). I knew I wasn't going to get accurate specs but I was hoping that they would indicate which of the Eminence specs to use.I used a fairly good Fluke Multi meter and the signal generator software I mentioned before.I first made a calibration table in Excel to compensate for the meter not being able to accurately measure RMS voltages at low frequencies. I made a table for 1V across my 0.5 ohm resistor and a table for 0.1V. They were pretty close and showed that the meter is accurate down to about 30 Hz (5% off) and looses it by 10 Hz (35% off)I tested with 2.8 V across the driver and measured at every 5 Hz from 100 Hz to 10 Hz. The results were put in a table, compensated and graphed. The results around 50 Hz (resonance) were too grainy (5Hz increments) so I decided to zoom in on the 40 to 60 Hz area and use 1 Hz increments.I also placed another 0.5 ohm resistor in parallel with the test resistor giving me a total test resistance of 0.25 ohms in series with the Alpha 8.The results were:Measured Alpha 8Qts=0.13, Qd=7.7Fr= 51 HzZmax= 79 ohmsZmin= 5.3 ohmsVad= 0.67 cuft"New" Alpha 8Qts=0.53, Qd=1.887Fr= 76 HzZmax= 45 ohmsZmin= 5.3 ohmsVad= 0.5 cuft"Old" Alpha 8Qts=0.5, Qd=2Fr= 75 HzZmax= 125 ohmsZmin= 5.34 ohmsVad= 1.5 cuftI was disappointed that my results didn't correspond with either! Any interpretations would be welcome.Cheers,Jeff
