
Subject: Using Eminence Gamma 10

Hi I am trying to make the best of what seems to be a bad speaker purchase. Based on the assertion on the Eminence web page that the Gamma 10 is "suitable for all hi power bass applications including bass guitar", I chose one of these drivers to make a small cabinet for my bass amp. I can't remember the exact cabinet specs, but made it according to the recommendations of a couple of design programs. The results have been disappointing, particularly low frequency response. Eminence seems to be a fairly significant discussion point on this board. Would any of the participants here have any suggestions or opinions on whether this speaker could be "made" to work in this application? Would using Pi Alignment make any difference vs. the typical ported design? If it helps, $V_{ad}=1.29$ cu ft., $F_s = 63$ Hz, and $Q_d = 1.96$. Thanks for your help and opinions. Stuart
