Hi Wayne, I would ask you about port dimensions of Pi Align model: back to my Pi Afterburner Eminence Beta12LTA:  $F_s=45$ ,  $Q_{ts}=0.51$ ,  $V_{as}=2,4548\text{cuft}$ , PiAlign give me  $V_e 2,454828132\text{cuft}$ ,  $F_{re} 33,08823529\text{ Hz}$ ,  $Q_e 1,388888889$  -to achieve exact  $F_{re}$  and  $Q_e$  for this box, the optimal port Diameter is 2.408" and Length is 2.515" (calculated in excel). Use of a larger port cause rise of the  $Q_e/F_{re}$ . Using this port dimensions in other software (WinISD for example) show me the red numbers for this port: 0,41 mach in Vent, that means noise or Doppler distortion risk. Have I to consider this risk or is it something different for the Pi align approach? Thanks in advance, O'Tor
