
Subject: diffraction, is it important?

hi gang, just finished reading about diffraction. they state that it is preferable to mount the driver so that the distances to the 4 edges of the baffle are unequal in order to eliminate diffraction.(i found it humourous in that their photo of a completed box had the driver mounted equidistant from the top and both sides, very similar to the way i mounted my driver). they also state having the driver flush mounted is desirable as well as rounding all edges of the baffle. my speakers sound great and am just curious how much improvement can be expected by following these parameters?thanks,george
