Hi Wayne...I bought a horn flare made by Sammi here in South Korea. It resembles CH-3 but a little bigger. Mouth size is 15 x 5 inches and depth is 7 inches. so the mouth area is 75 square inches. So the horn cut off frequency is a little lower than either CH-3 or H290 since the mouth area is bigger. It is a bi-radial with diffraction slot at the end. Do you think this is suitable for the PSD2002 on theater 4 pi?. Or should I buy another horn flare?. What effect can we expect by using bigger (lower cut off) than normal horn flares? Sammi make sh-350 which is similar to h290 by look and spec. They also make sh-360 which is similar to ch-3. If I have to buy another horn which one do you think is better? Thanks in advance Hunmoo
