Hi Craig,I calculated Pi Align for RS-1354 some time ago, but not built them.Where I was confused was a really small port dimensions.In the Pi align, there is another factor to be considered, whichis the ratio $Qe = Lp^2/Ap$. For RS-1354 in 0.234 cu ft Pi aligned box tuned to 41.6 Hz, this ratio is 2.206. The only possible port dimension I found is Dp=0.414" and Lp=0.545" - not a huge port, it risks to produce some noise, IMHO.I do not understand exactly how important is to keep this ratio close to calculated Qe value. What's more important: use such a smallport or make the port bigger and then keep right values for Qe or rather for Fre?O'tor
