In the crossover diagram you show C5 as this $C5 = L_e / R_e^2$ Now the Kappa 151fa has $L_e = 1.27$ mH and $R_e = 5.4$ ohms. so.... $C5 = 1.27 / 29.16$ $C5 = 0.0435$ uF This seems really inconsistent with any of the C5 values listed in your crossover diagram. They are all at least 20 uF. What am I doing wrong? Thanks Adam
