Well, I don't know about a stand.  It would have to be one mighty stand.  I thought about putting "tip toes" under my Theater 4s, but I ended up just putting a strip of 3/4" mdf under the front baffle to prop it up and aim it a little more at ear level.  Someone had posted this idea a couple weeks back, and it ended up making a notable difference, at least for me.  Of course, that may just be the room.Kevin
