Hi Wayne, No, there isn't any news yet. I have a temporary motivation problem, and currently not building anything. Although I still have two projects waiting. But I do have a question for you. I finished my new PA-subwoofers now a while ago, and I did listen to them a few times. And I'm very impressed by the sound. As you would probably have read in my earlier threads, I used the RCF L15/554K. Do you know these motors, or did you consider RCF FOR THE pi designs? I would like to hear more comment on them. Another question, do speaker motors are sensitive for specific climates inside a house. Like to dry and warm, or to cold and moist? Since all of my motors have paper cones, I was curious if climate would shorten their lifetimes. Bye, and thanks Erik
