Hi Thomas, Well, you would be amazed by the magnetic field coming from the magnets, they would molest your tele. When I was still living with my parents, I had a very small tv. I one-time finished my first sub, and used it for a while in my room. I put the television on it. After a few days I finally noticed the change of color in it. Red became green. I found out it came from the sub's magnet. The change in color didn't go away until a friend of mine banged it on the floor a couple times. Interesting story, no... ..nevermind! I'm planning on buying a THX certified AV-receiver. It must be a thrill. The new types have all new decoders and a flashable 1mb chip, for upgrading in the future. You can link practically everything through them, and with a good remote and the built-in 12v triggers you can operate everything from your chair (screens and light as well). And you have 6.1 and 7.1 output (6.1: you have extra rear centre, 7.1 you have extra pair surrounds). Plus loads of options for expanding and playing around. Beats me, would be something! Kinda like nice subs, but if the theaters will do, alright! One problem, thx-receivers will let everything above 80Hz for the main and surround speakers. The subs get 80Hz and less. Don't think one can set amp for letting everything through to the mains. Thanks, Erik
