Hey bud,I Pialigned a Seas Excel 7" for use as a midbass in vehicle, running down to 60 Hz.It came up with some somewhat odd results which plotted funny in my box program (it gave me a response peak), but maybe I just mistranslated them. Anyway, I tweaked it slightly from what Pialign gave me, I placed it in a 0.33 cuft tuned to 51 Hz. Gives me flat response to 50 Hz, which is fine in this case because it'll only be operating 60 Hz and up.Is there any chance you could check this out and tell me if this box design would still sound great for the midbass? This is one of the best midbass drivers in existance, but I've never heard of it being run in such a small enclosure before, and it strikes up a bit of worry. Since you have a ton of experience with these overdamped ported box alignments, I thought maybe you could help me out.Thanks bud.Here's the woofer specs:<http://www.madisound.com/seas/e017.pdf>Adam
