I have just completed a pair of theater 4pi. It does sound wonderful.I put them in corners and the stereo image is precise. A soloist voiceappears to come from a precise point between the loudspeaker. Thesoundstage is large also. Other speakers that I have built in the pastdid not have this kind of precise stereo image when put in corners.I have one question about the heat being dissipated by the powerresistor used in the woofer compensation circuit. How hot can it get?I screwed it against the back wall behind the woofer. If I putinsulation over it , would it overheat and fail or even cause a fire?I am paranoid about this because these speakers will serve as speakersfor our church organ and will be isolated by themselves in a darkenedsound box without anybody paying any attention to them.Thanks
