rising response through the midrange. They're very efficient full range speakers and their bass response is nice, but in large rooms or outdoors they could definitely benefit from a sub. They're best if you put them in corners or against a wall. Also, the compression driver is attenuated 10dB, but if your room is very reflective, you might use one of the compensation cable assemblies that provides more attenuation, like the 12dB or 14dB version.
