You could keep the attractive small size of the 2 Pi and still have the tweeter fire at your ears by sloping back the front baffle about 22 1/2 degrees. Increase the height by about 3 1/2", starting the slope from that far above the floor and then making the depth of the top about 6 1/4" instead of 10". The internal volume would be about the same.I think some Infinity's used to be made that way and some of the Meadowlark's are. Those are "time aligned" but the real virtue is in having a lower tweeter beam at your ear. In fact, the 42" tall Kestrels with the sloped baffle caused me to put 8" tall extension legs on my sofa to get a good image!
