So your cabinet will be about 9 cubic feet and have a 6" x 10.5" port that's 14" long. Is that what you decided on? Will your 511's be baffle mounted or will you mount them externally, on top? About your crossover, maybe we'll look at your crossover with a signal generator and scope and set it up with that. I think there's lots of people here that would be thrilled to have an active crossover using tubes, and to know the component values that should be used to provide the appropriate response curve for their horns. By the way, Mitch left for Norman this weekend,

are tuned similarly too. The port isn't as long or have as much cross-section area, but the

interchangeable in either cabinet. I don't know if Mitch will be one of your students this semester, but we'll all get together sometime soon, in any event.
