Well, does anybody have idea, in what enclosure I can put a 13cm driver with Qts=1.20, Vas=25 l, fs=80 Hz. This is driver 4 ohm intended to use in car. But, I don't use it, and my friend wants to build something active to play with PC audiocard. Is it possible with this driver? It seems to be a huge enclosure because of Qts=1.20 and still with big ripple...Anything to do?Thanks in advance
