three things on my mind - lol#1 Is there a correlation between a woofers x-max rating and "tight bass" ? if you know what I mean (loose suspension and tight suspension). Do "tight coned" woofers sound better than "subwoofers", or is this just a myth?#2 Is there a correlation between a woofers voice coil diameter and "tight bass" and/or sound quality assuming similar woofers? or is the voice coil just a function of power handling, not sound quality ? ie, if JBL made a woofer with a 2" voice coil would it sound as good/bad as the same one using a 4" dia voice coil ?#3 What factors do you look at when trying to find a woofer with a strong motor ?
