Subject: Help Computer Mavens: "Image Too Large"

Wayne kindly emailed me the 2 Pi plans, but when I downloaded them and then tried to open one of the images, a message, with exclamation mark, popped up from the kindly folks at MicroSoft: "Image Too Large (Too Many Bytes)". I've looked at the Q's and A's for the software but of course this problem isn't mentioned. Any ideas?I'm using a new IBM thinkpad, newly loaded with softwear, on loan from my wife's technolgically-advanced office (my old PC failed following a lightning storm this summer).I bought some plywood (for practice) and MDF panels yesterday, so I'm raring to go. If I can't get the pix opened today, can I use the dimensions on the site (22 x 15 x 10, I think) to cut the panels? Are those internal or external dimensions?
