Hi Wayne, You probably get sick of all the proposed "changes" to your designs, but I was just wondering what you thought of putting the APT50 (on whichever flare) into a Studio 2 Pi tower? I know that the Motorola Piezo is great for this speaker, but thought that this might be a cool experiment. The two devices have very similar frequency curves and roll off around 3.5 kHz but the APT is more sensitive (around 105 dB). I don't know if this would require a crossover or if the tweeter could just be attenuated to compensate and still run the drivers full range? Thanks for your help. Rich
