Hello all,I'm in the process of building my 2 Pi's and I have a really stupid question about the port length. On the plans, is the listed $1\frac{7}{8}$ " length the total length including going through the front $\frac{5}{8}$ " panel OR am I supposed to have $1\frac{7}{8}$ " length total after going through the front panel (IE - the total length would be 2.5")? I'm assuming the port length should be a total of $1\frac{7}{8}$ " but I want be absolutely sure.Also, what is the maximum power handling capabilities of the 2 Pi's?Thanks,-Mark
