wayne & fellow freaks, i was at my friends house the other night who runs a pair of jbl 4655's (tent sale 15" 2 way with response to 80hz) on top of a pair of pi-aligned kilomax 18's in a 9 cf box. he's using an electronic x-over between the 2 speakers. we set it at 150hz and it rocks. the x-over has a 24db/octave slope. what x-over point is optimal for this set-up? he's running a pair of heathkit 35 watt tube monoblocks on the jbl's and an adcom monster solid state on the 18's.cheers,george
