As I recall, that was an early attempt at matching directivity. While I applaud this in general, I don't think the Altec sectional horns are good candidates for this approach because they're not CD. Add another crossover point to device with another very different coverage pattern and I think matching the directivity at 1.2kHz becomes mute. That said, as you know, I do believe that uniform directivity is important and propose systems that achieve it as much as possible. I just don't think this one can.
