Hi Wayne, I've been thinking about your corner horn design, and the one thing that's been bugging me is that as designed, the soundwaves are being focused into a corner, then reflecting past each other to be sent into the room around the sides of the cabinet. Can you comment on placing a wedge in the corner as a reflector? I've attempted a top view ascii version below. Assume everything is at 45/90 degrees and the point of the wedge would be against the baffle board. Thx, Chris
