I like using T-Nuts for mounting the heavy stuff and self-tapping screws for lighter duty. And when I say "lighter duty," that includes most of the drivers that weigh less than about 25 pounds. The biggest advantage to T-Nuts over pans screws is that they won't weaken or strip over time with repeated assembly and disassembly. If you aren't much of a "tweaker" and don't plan to go inside them often, then the self-tapping pan screws will be just fine. Also, there's a link to a big online fastener distributor in the post called "Black pan screws for mounting small drivers." If you can't find what you want at the local hardware store, this place will certainly have what you need.
