I notice that the crossover in the RS tweeter has an inductor(.26mH). I assume this is a 12dB crossover.What if the inductor is removed? Can the crossover point be raised from what I believe is too low? Does a larger cap or a smaller cap than the stock 2.2uF effect such a change? I want the super tweeter to take over for the PSD 2002 in as natural a way as possible(least electronic filtering concurrent with phase coherence)using the natural roll-off of the Eminence tweeter. Thanks.G.
