Cool, makes sense. One last thing, the sealed box resonates at F_0 , so that's where control is the least. On a vented box, is control the least at F_b because that's where it resonates? Or is it F_0 and F_b because there's a Helmholtz resonator and the shifted mechanical resonance of the cone? I wouldn't think it's F_0 because apparently that's right no near F_h . Thanks! Adrian
