Hi Wayne,  I guess my question is about how to select a driver by reading itsspecs.  In this case, both have an Fs of 29Hz.  The only remarkabledifferences are the one point is Vas, and the significant differencein Qms.  Is it reasonable to think you can predict a speakers freq.performance based on reading specs alone, or does this capabilitycome from running the numbers on a variety of drivers to get afeel for how each of the specs effect the result?  In other words,plain old experience.  I there a table that describes how eachof the specs inter-relate? Something like, "Vas and box size areproportional.  Qms is proportional to low end performance, but theoptimum value is around blah with a Vas around blah."Thx, Chris
