Subject: A couple questions about Pi-alignment

I am designing an enclosure for a high-Q full-range driver, simple BR design.In terms of calculating the optimum enclosure volume, resonance, and bandwidth, is the Pi-align whitepaper the best source? I only ask since it is dated 1979, wondering if it is state-of-art for Pi-alignment.Also, in the formulas on page 5, I don't recognize some of the parameters from the typical T/S params.Anyway, any advice would be appreciated.
