my timeframe is overawhile-i have polytech that i need to finish - it may be christmas holidays-Dec5thbecause ive just completed my 2week holiday(and finished completeling the modeling),and my mates relative whos a woodworker is busy makn my mates bedroom like a sleepout,so wudve been busy.this will be good to see if a 30hz 750L horn is justifiableas soon as i finish the niggly bits-the corner reflectors,completely optimising the rear chamber to be correct 17L+2L for lab12 woofer+bracing,and drawing it more times in Qcad with really skinny linesone of my problems is my little 14" monitor cant display it all at once! :P 800x600this horn is for the Experience not for perfect response..250L only,how can u go wrong :-Pim thinkn 25mm mdf always that rear chamber brace is infact vertical :*)and then il get RS meter(with new mic like adrian has),test it outdoors,in car,in home,in corner,see if can squeese 40hz out of it with a few watts :-DCheers!
