Wayne, I think I want to make a attempt at using my JBL 2226's in a corner cabinet. I already have found out how versatile they are in a BR enclosure. Interesting question for you here: If the corners are the same as a fold in a horn, will response to 1.6Khz still work??? Another question if I might: I plan to place my horns on top of the cabinet like I do now, since the woofer will be firing backwards, and the horn forward, how is the voice coil alignment figured out??? I am wondering if you take the woofer wave into the corner and return back, is that taken into account when figuring the time/phase alignment??? Thanks, Ron
